

KuCampusBite

WHERE HUNGER MEETS CAMPUS HUSTLE!

Course Title : Software Project Management (CS-458)

Class: BSCS – 2nd year B (4th Semester)

Team Members:

Humaima Moin (B23110006043)

Lamia Gul (B23110006055)

Neha Rehan (B23110006131)

Sana Ghulam Rasool (B2311006147)

Sania Khan (B2311006148)

Date: / /2025

Business Case: KuCampusBite Website

- **Need:** Students face long canteen queues and have no digital food ordering system.
- **Solution:** A food ordering platform for KU campus canteens with real-time order management.
- **Benefits:** Saves time for students, Reduces physical rush, Increases sales & efficiency for canteen owners, and Enhances campus digitalization.
- **Cost:** PKR 30,000, 3-month timeline
- **ROI:** High adoption expected due to convenience
- **Risks:** Internet dependency, adoption resistance, and Canteen cooperation challenges.
- **Alternatives:** Manual orders (slow & inefficient) or social media orders (unorganized).
- **Recommendation:** Launch web platform; monitor feedback for future scaling.

Business Case – KuCampusBite

Executive Summary:

KuCampusBite is an innovative online food delivery website tailored specifically for the University of Karachi's students. This system allows users to pre-order, schedule, and reserve meals from campus canteens, helping them skip long queues, manage their lunch timings, and ensure availability. The platform introduces smart delivery options, depending on individual canteen policies (free, low-cost, or standard delivery charges), giving flexibility to the users.

This business case recommends developing and launching the platform to enhance student experience, modernize canteen operations, and optimize food delivery logistics across campus.

Business Need:

Currently, students at the University of Karachi face several food services issues:

- Limited break time makes it difficult for students to travel across the large campus to reach canteens, especially those located far from their department.
- Long queues during peak hours result in many students skipping lunch or settling for low-quality alternatives.
- Insufficient seating capacity in canteens causes further delay and discomfort, making the dining experience stressful rather than relaxing.
- High travel costs within campus (especially for students relying on rickshaws or shuttle services) discourage them from frequently visiting distant canteens.
- Food often runs out early, leaving many students without access to proper meals.
- Some students want food from another department's canteen but it is far, and they have no easy way to go there.

Students face limited time, long queues, low seating, and high on-campus travel costs—often missing meals, which affects health and focus. With no unified system for food ordering or delivery, a centralized digital platform is needed to streamline access, save time, and reduce effort.

Project Description:

This project aims to design and develop a web-based platform that connects students with all university canteens, enabling them to browse menus, place and track orders, and get food delivered anywhere on campus for free.

MAIN FEATURES

- Student Side (Portal)
- See menus of all canteens.
- Order food and even schedule it for later.
- Give ratings and feedback.
- Canteen Side (Dashboard)
- Add or change menu items.
- See and manage new order.
- Make delivery fast by having set pick-up and drop points.

Alternatives:

If making a full website is too hard or expensive right now, here are other easy ideas:

- WhatsApp Ordering
- Each canteen has its own WhatsApp number.
- Students send orders in chat using a simple menu.
- Mobile App
- Same as the website, but as a phone app.
- 3. Work with Existing Apps
- Partner with apps like Foodpanda or Careem to deliver food inside university.
- 4. Digital Token System
- Students book a number (token) online.
- No need to stand in a line. They come when it's their turn.

Benefits:

- Time saving for students by avoiding long queues.
- Reduces physical crowding at canteens.
- Improves canteen management efficiency.
- Increased sales due to smooth and faster service.
- Reduced order mistakes due to written digital records.

Costs:

Estimated total cost: 30,000 PKR over 3-months.

Includes domain & hosting, maintenance, marketing, and canteen staff training.

Risks:

- **User Privacy & Data Protection:** Risk of customer data being exposed or mishandled, compromising their personal information.
- **Website Crashes During Peak Hours:** If the site slows down or crashes during lunch rush, users might get frustrated and leave without ordering.
- **Outdated Menu Issues:** Showing items that are out of stock can lead to disappointment and confusion when customers place orders for unavailable food.
- **Order Miscommunication with Kitchen:** If the kitchen doesn't receive orders properly, meals could be missed or mixed up, leading to unhappy customers.
- **Dependency on Internet Connectivity:** Poor or lost connection can interrupt the ordering process entirely.
- **Challenges in integration:** Integrating the website with existing KDS, POS, inventory, and payment systems can lead to order delays, data mismatches, or manual entry errors.
- **User Adoption and Acceptance:** Staff and customers may resist using the new system if they're not comfortable with technology or don't fully trust online ordering, making it harder for the canteen to shift away from traditional methods.

Implementation plan:

Duration: 3 months

Team size: 5 members

1st month: planning & core development:

During this phase we will finalize system requirements, design the user interface, set up the database and begin backend and frontend development with core features.

2nd month: Map Integration & Workflow Completion:

We will integrate Map API for delivery routing, complete the rider interface, connect all user roles and ensure the full order delivery flow is functional.

3rd month: Testing, Optimization & Deployment:

In the final phase we will conduct testing, fix bugs, optimize the interface for all devices and deploy the system online.

Recommendation:

It is recommended to move forward with the development of KuCampusBite, as it offers a well-planned and realistic solution to a common issue faced by students on campus. The project is clearly defined, aligns well with student needs, and can be completed within the available timeframe and resources. With a committed team and thoughtful use of

technology, KU Campus Bite has strong potential to make a meaningful impact within the university environment.
